

Figure 5.Installation location

5.2 Environment selection

According to the work of instrument characteristics and technical performance, the choice of instrument installation environment should pay attention to:

- (1) Meter should be installed in dry and ventilated place
- (2) Instrument should avoid the sun and rain. Outdoor installation, should be sheltered from rain water facilities;
- (3) Avoid strong shock while installation site as possible.
- (4) Try to avoid a strong electromagnetic field equipment, such as large motors, large transformers, etc.
- (5) Choose easy maintenance, more convenient place.

5.3 The choice of installation location

Install the sensor in the pipeline, should note the following:

- (1) The direction of the flow sensor is the same as the media flow.
- (2) Must ensure that the sensor tube is always full of measured media
- (3) There should be 5 times straight distance of tube diameter upstream The position for installing must be 3 times of conduit diameter in the front and 5 times of conduit diameter in the back.
- (4) When the pipe diameter is inconsistent with the sensor, install the divergent tapered tube or pipe at the both ends of flow meter, and then connect to pipe. The cone angle of diverging, converging tube should be greater than $2\theta \sim 15^\circ$. When using 15° cone angle of diverging, converging tube, you can see Head loss resulting from the curve in Figure 6 investigation.
- (5) Horizontal installation, the electrode should be installed in a horizontal position. Thus, once the media containing bubbles or precipitate substance, air bubbles will not adsorbed on the electrode, cause the disconnect of the signal converter. Sediment will not cover the electrode which may cause Zero drift.
- (6) For the liquid-solid two-phase medium, vertically installation is more favorable. First it can prevent the separation of measured media, second sensors can wear more evenly lining. Vertical installation, medium flow direction should be bottom-up, this will ensure that the sensor tube is always full of media measurement.

Figure 6. Loss from installing the divergent tapered tube or pipe

5.4 Ground connection

The signal produced by sensor is very weak, only few mV even in full detecting range. See picture 7~9 as reference to make sure the ground connection is well.

Ground electromagnetic flow meter is based on two aspects:

- (1) The action principle from the electromagnetic flow meter and flow sensor signal current of the loop analysis, ground must be measured media the same potential.
- (2) The earth is zero potential, reduce the external interference. Under normal circumstances, process pipes are metal pipe, an they are all ground-connected. However, in the case of larger external electromagnetic interference, Electromagnetic flow meter grounding device should be set. Grounding line is greater than 4mm^2 , which total cross section using multi-strand copper wire.

Sensor ground wire must not be connected to the motor or other devices in public places online, grounding resistance should be less than 10Ω .

Sensors is installed in the metal pipe, insulating coating of metal pipes when the wall is not grounded in Figure 7.

Figure 7. Sensors installed in the metal pipe grounding diagram

1. Grounding line (large disturbance installation)
 2. Instrument ground wire (meter factory with)
- Installing the sensor on the plastic pipe or pipe with insulation liner, Should has grounding ring or ground flange or Short tube with a ground electrode at both ends of the sensor. See Figure 8.

Figure 8.Installing the sensor on the plastic pipe or pipe with insulation liner

1. Grounding line (installed when the interference is serious)
 2. Ground wire (one of original accessory)
 3. Ground or ground ring flange
- Sensors installed in the pipeline cathodic protection must be carefully installed in the ground at both ends of the sensor ring (or ground flange), see picture 9

Figure 9. Diagram for installing Pipeline cathodic protection in the ground

1. Grounding line (installed when the interference is serious)
2. Ground wire (factory has)
3. Ground or ground ring flange The flange connecting pipe must be insulated
4. Bolt (flange should be installed and insulated from each other)
5. Connecting wire, copper cross-sectional area of 16mm^2 , separation between the cathodic protection potential and the sensor

6. Electrical connection

All output wires owned by the user, please note that the load current requirements to meet. Sealed structure applied for power outside of the outlet holes, it should be compressed tightly for the wiring outlet hole gasket after connecting the wire, threaded fittings tightened to prevent the erosion of moisture and corrosive gases.

6.1 Terminals as shown in Figure 10

In+ Input node

6.2 Power cable as shown in Figure 11

Power cord can be two soft rubber insulated cable core, the proposed model YHZ-2 x1mm2

For DC power converters should be noted that wire resistance and supply voltage, generally in the 24V power cable resistance should not exceed 10Ω . Resistance of the power cord from the wire length and cross section determined.

Figure 12. Power line wiring diagram

6.3 Analog output shown in Figure 12

Divided into two analog output signal system: 0 ~ 10mA, and 4 ~ 20mA signal system. When used, the user preferences in the two signals of the system can select one

Analog current output for the 24V internal power supply, the 4 ~ 20mA signal system, capable of driving 750Ω load resistor 0 ~ 10mA signal for the system, the current zero "0", 4 ~ 20mA signal for the system, the current zero to 4mA. Therefore, in order to improve the resolution of the output analog current, the user should select the appropriate flowmeter range. Range of the converter can be selected automatically adjust to meet this requirement Ultra-scale current output of approximately 22mA maximum The manufacturer has analog output of each parameter calibrated When the flow meter at the factory. Under normal circumstances, no further adjustment of the user. If unusual circumstances, require the user to calibrate the analog output, simply enter the current zero point correction and the current full-scale amendment to the menu, the following operational procedures carried out without external signal source.

(a) Instrument calibration

Termination of 0.1% in the current output level ammeter (or connected 100Ω resistor and 0.1% standard digital voltmeter into 0.4 ~ 2V voltage measurement). Power meter run for 15 minutes so that the internal instruments to achieve thermal stability, and ready to adjust the current output range of zero coefficients and coefficients.

(b) Current "0" point correction

The converter set to the parameter setting state, choose the "current zero correction" item, entering, adjusting the correction coefficient, the ammeter indicates exactly 4mA ($\pm 0.004\text{mA}$). Press the Enter key. Press the Enter key.

(c) Current full-scale correction

Select the "current range correction" parameter, enter, adjust the correction factor converter, the current meter just indicates 20mA ($\pm 0.004\text{mA}$) Adjust the current "0" point and full scale value, the converter will be able to guarantee the achievement of the current function of accuracy. Current output of the converter linearity within 0.1%.

Figure 12. Analog output

6.4 Digital output as picture 13

Figure 13(a). Optical digital output coupler connected (eg, PLC, etc.)

Figure 13(b). Optical digital output coupler connected (eg, PLC, etc.)

Users around the optocoupler to be 10mA current, so, $E/R = 10\text{mA}$ or so, $E = 5 \sim 24\text{V}$. Therefore, $R = 0.5 \sim 2.5\text{k}\Omega$

Figure 13(c). Relay digital output

Note: General E relays need to 12V or 24V. Freewheeling diode D is currently in the middle of most of the diode inside the relay. If the relay itself does not contain the diode, the user should be outside after another.

6.5 RS484/RS232 communication as picture 14
S484/RS232 communication, connected by two equipments to communication

Picture 14 RS484/RS232 communication

6.6 Figure 15 Input nodes
External control contact input (IN, IN-) by a switch or relay contacts ON / OFF control, shown in Figure 4.8. Note that the resistance between contacts should be less than 5Ω.

Figure 15. Connecting point

7. Instrument parameters

7.1 the definition of instrument and display panel see picture 16

Figure 16. Display

7.6 instrument parameter discription
According to the manufacturer set the actual size of the sensor, the sensor works diameter size range of 15 ~ 200mm

• Sensor Size
Note: This set according to user needs, the user can not be changed

• Flow Range
Range of the instrument is the maximum traffic flow measurement value (full scale). Maximum flow value is displayed for the output signal and in terms of percentage. It limits the output current and frequency (pulse) output and 100% upper limit corresponds to the displayed value. Also associated with the small percentage of flows that resection and limit alarm signal. The converter displays the flow velocity is not within the provisions displayed in the limited flow range. Setting parameters in the selected range of the instrument flow display units, flow meter display unit, volume flow units: L / s, L / min, L / h, m³ / s, m³/min, m³ / h and the mass flow units: kg / s, kg / m, kg / h, t / s, t / m, t / h, the user can process requirements and usage, selected an appropriate flow of display units
Notic:Instrument display with 5 digits flow values, the values behind the bottom of the unit showed flow

• Auto Rng Chg

Figure 17. Tow ratetransmittance

7.2 key function
There are two kinds of status running: Automatic measurement of the state; Parameter setting.
Power meter, automatically enter measurement state. In automatic measurement mode, the measurement instrument and automatically display the corresponding test data. In the parameter setting state, the user keys four panels to complete the instrument parameter settings. Instrument parameter settings in the English table in Appendix 2
• Key features automatic measurement
The following key: Cycle through the second line of the display screen
The upper key: Cycle through the third line of the display screen
Composite key+ Confirmation key: Enter the parameter setting state

• Key function under the status of parameter setting
The following key: Reduction 1 at the area of cursor
The upper key: Add 1 at the area of cursor
Composite key+ following key: Left shift the cursor
Composite key+ upper key: Right shift the cursor
Confirmation key: Entry / Exit sub-menu
Confirmation key: In any state, continuous press for two seconds, return to the automatic measurement of the state

Note:
(1) Press the upper key or the following key at the same time after pressing the composite key when composite key is used.
(2) In the parameter setting state, there is no key operation within 3 minutes, the meter automatically returns measuring state.
(3) Flow of zero correction options, you can move the cursor to the left of + the - using "the upper key" or "the following key" so that the actual flows in the opposite.
(4) Flow unit selection can move the cursor to "flow range settings: flow units that menu display.
Then use the "upper key" or "under the key" to switch to meet the needs of

Converter with optional automatic switching of the two ranges can be easily used for a large range day and night flow measurement system of automatic control. In the "flow range settings" menu to set the range value of the first range (high range). In the "automatic range switching" menu option 1:2, 1:4 or 1:8 as the second range (low range), the second range is the first scale value of 1 / 2, 1/4 or 1/8.
Figure 11 is a ratio of 1:4 scale automatic range switching curve. To switch the safe, reliable, automated set of 5% to 10% of the hysteresis

• Damping
• Flow Dir
Long damping time can improve the measurement of flow meter shows the output signal stability and the stability of the situation for use with flow control; a short measurement time can speed up the measurements reflect the damping rate, the cumulative total for the pulse flow measurement. Damping time measurement set selection method used, the user can select a damping value
If you think that debugging is positive when the flow direction, while the instrument display is negative, then set the reverse flow direction, and vice versa

• Flow Zero
Electromagnetic flow sensor in the measuring tube filled with conductive fluid, and the fluid does not flow at rest, the converter has been done on the flow meter zero intelligence processing. If the sensor with zero out of range of converter you need for intelligent processing flow of zero correction. Flow velocity of zero is expressed in units of m / s
Zero flow correction converter is shown below
Display: Uplink "baseline" represents the zero point measurement instrument, revised downward the value of the display is zero flow. When the "reference" display is not "0", the correction value should be adjusted so that baseline=0
Note: If changing the downward correction value, "base" value increases, the value need to be changed down the positive and negative so that the "base" value will be 0

7.3 The operation of parameter setting
In test mode, press the "composite key +confirm key" appear state transition occurs password (0000), enter the appropriate password, then press "Enter key", you will enter the parameter setting state

7.4 instrument password
Either level password, users can look at the instrument parameters Password level 0 (fixed value 0521): Users can look at all the parameters, but can not be modified.
Level 1 password (default 7206): Users can change parameters 1 to 25 meters;
level 2 password (default 3110): Users can change parameters 1 to 29 meters;
Level 3 password (fixed 2901): Users can change parameters 1 to 38 meters;
Level 4 password (fixed value): the user can change the parameters of all the parameters and initialization, a manufacturer factory master.

7.5 Parameter setting menu
Electromagnetic flow converter total of 44 parameters (here only to users 38 parameters). Converter parameter setting menu shown in Table 3

Amendment must be zero flow sensor electromagnetic flow measuring tube filled with conductive fluid, and The fluid does not flow at rest under the condition
Correction value is zero flow sensor calibration constant value, the record shall be credited to a single sensor and signs. Sensor zero value is recorded Pops contain symbols "m / s" as the unit of velocity values

• L.F.Cutoff(Removal of small signal point
Cut point of the small signal range setting is expressed in percentage of flow. Choose to allow removal of small signal, When the flow velocity is lower than this value will be removed when the flow rate, flow rate and percentage of the display and the signal output; if you choose stop, it will not to make any cut

• Rate-of-Chng & Limit Time
Rate of changing and limi time is used Used to eliminate some of the increase in damping can not remove the noise. It can be a real flow signal from the judge due to a step signal noise and noise-like slurry tip. This identification is based on the rate of change and duration of restrictions based. Figure 18 shows the rate of change limit for the use of technology to remove the principle that gross errors.
If the current sample of flow data above or below this limit, and in more than or less than the changes within the time limit is that such changes caused by the noise, the system shall be removed; and when more than or less changes in this limit is not sensitive to the set hours, then that the change is caused by changes in the real flow, the system is to measure the flow rate changes approved. Change rate setting range from 0 to 30% within the selected time is not sensitive to the choice in the 0 ~ 20s. When the rate of change is not sensitive to the time limit and any value between 0, this function will be turned off

Note: 1. No. 35 and 36 for the power-down time of the record, no power-down function converter, this parameter is invalid.
2. The total is set to 36,666 factory password is cleared

Figure 18. The rate of change limits use of technology to eliminate gross error noise

• Total Unit (Flow units)

Converter is 10-bit display monitor, the maximum allowable count is 999999999. Totalizer units using the L, m3, and kg, t. And have to 0.001,0.01,0.1,1.0 the rate of the units display. Period of time can be easily read out the accumulated flow. Converter used to automatically determine the flow rate totalizer units and whether the overflow
Converter with a mass flow measurement function. Users to set the density of different media, values range from 0.0000 ~ 3.9999, The value is actual medium density and water density, the This value is the actual medium density and water density, the relative value

• F.Total Set & F.Total Set

Forward and reverse the total amount pre-pre-converter is reserved for the replacement of the original value of the cumulative flow totalizer values to maintain a continuous cumulative total of successive

• Input Contro

The converter has a contact input controls, mainly for remote cumulative volume cleared, the cumulative amount of simultaneous display and volume control input
Select "prohibited", the function is canceled
Select "prohibited", the function is canceledSelect the "cumulative stop", the use of synchronization with the steering switch, the converter can flow totalizer and other standard containers or standard Flow Totalizer countsynchronization, the synchronization stops
Select the "Remote cleared", you can dry the flow of integrating totalizer value

• Date--y/m/d & Time--h/m/s

4 user password to enter, you can change the time of year, month, day, hour, minute, second.

• Password L1 & Password L2(User password 1~2)

Using level 3 and level 4 password to access ,user can modify this password

8. Maintenance and Troubleshooting

8.1 Preparation

Check the connection and installation seriously according to the manual before operation.
The flow meter is already adjusted well during the producing process, please read the manual before operation and adjusting any parameter for it; otherwise, it may cause damage.

• Current Type

Users can select the current output type 0 ~ 10mA or 4 ~ 20mA analog current output

Notic: When the user specified in the order which current output, the factory set according to user requirements, user changes invalid.

• Pulse Output

Pulse output frequency output and pulse output are both available. Continuous square wave frequency output, pulse output for the rectangular pulse train; frequency output are used for instantaneous flow measurement and the number of total short-term accumulation of impulse equivalent pulse output by choice, read out the value of the cumulative volume of flow, used for a long time cumulative total volume of units directly.

Frequency output and pulse output gate output is generally the form of OC. Therefore, should an external DC power supply and load. Pls see figure 6

• Pulse Factor

Pulse equivalent definition: mass per unit volume or unit number of pulses gene rated
In the same flow rate, pulse equivalent high, the output pulse frequency is high, the cumulative flow for electronic counter; pulse equivalent low, low frequency pulse output, suitable for high frequency up to 25 times / sec mechanical electromagnetic counter.

• Freq.Max

Meter frequency output range corresponding to the upper limit of flow measurement, the percentage of traffic that is 100%. Frequency output upper limit can be 1 ~ 5999Hz range arbitrarily set.

• Emp Pipe Alm

With empty pipe detection instrument, if the user chooses to allow the air flow control alarm, when the instrument detects air flow control state, about instrument analog output, digital output signals set to zero, and will show zero flow meter.

• Emp Pipe Alm

24 Empty Tube alarms and alarm electrode current source method is 25

8.2 Maintenance

Electromagnetic flow meter generally do not need regular and frequent maintenance,That is necessary to clean those parts which material attached on, such as electrodes. Notice that not to damage the liner or electrodes.

8.3 Troubleshooting

8.3.1 Common troubleshooting:

For researching, there are three parts needs analization

- (1) The flow of the pipeline (or less full control tubes), medium character(scaling, etc.) and the ambient may effects measurement.
- (2) Failure of the sensor itself;
- (3) Converter failure.

Then analyze the causes of production, troubleshooting.

Table 7. Common Troubleshooting Methods

Failure	Cause	Inspection methods
There was liquid flow through the instrument but no instruction	1, Moisture or damage of signal line cause ground short circuit. 2., Signal short circuit 3. Excited circuit opens. 4.converter failure	Check the insulation of signal cable with a multimeter . Check the signal pathway with a multimeter. Check sensor circuit is intact or not with a multimeter Fuse breakdown or other reasons.
Ultra--flow changes, but full--scale instrumented	1. A signal line is short circuit to ground connection or open circuit, 2, Sensor tube is not full of measured media, 3.Poor ground connection	Check the signal of line-to--ground resistance. When material fills the tube, use multimeter to detect the ground resistance of electrode. Generally, it is 1000 ~10000 Ohm. Check the signal cable is with a multimeter access, improved installation, Check the signal and ground shield resistance and re--install the grounding device.
nconsistent with the actual flow meter indicates	1. Measurement error due to changes in zero, 2. Range of the instrument calibration factor is incorrect. 3. Measuring tube is not fully measured media. 4.Scales attached on electrodes or inner walls . 5. It is use for display the real inherent error.	Bad or contaminated ground electrode, excluded it and the recovery of the original zero, Re--adjusted by the index values range calibration . Improved installation Clean the scale. Compared with the standard flow meter.

28 29

measured by the sensor electrode resistance, do the smart judge. Resistanced by formula of electromagnetic flow meter signal.

$$R \approx 1/d \sigma$$

Where d--diameter of the electrode, σ -- electrical conductivity of the fluid, the electrode resistance is generally 5 ~ 50K Ω . Resistance and fluid conductivity measurement, the electrode diameter relationship. Measuring Resistance to reflect the electrode surface contamination, adhesion, and polarization by the impact of different electrolyte fluid situation. Fluid can not be filled, the electrode sensor can not correctly detect the signal. Electrode resistance measurement to provide status information to the system, a system to make air traffic control and the electrode to determine abnormal, the user accordingly to make the appropriate electrode maintenance. The converter to the preliminary test based on the value of electrode resistance, electrode resistance to select the appropriate threshold (generally the initial test electrode resistance parameter reference value of 3 times the threshold). Resistor current source means the measurement from the length of the cable to make the operation more convenient, more reliable detection.

• Hi Alm Enbl

Users choose to allow or prohibit

• Hi Alm Limit

Alarm value upper percentage range, the numerical parameters set up, the user between 0% and 199.9% to set a value. Meter run, when the flow rate is greater than the percentage of the value, the instrument will output alarm signal

• Lo Alm Enbl

Users choose to allow or prohibit

• Lo Alm Limit

Lower limit alarm value to range in percentage terms, the numerical parameters set up, the user between 0% and 199.9% to set a value. Meter run, when the flow rate is less than the percentage of the value, the instrument will output alarm signal

8.3.2 Converter failure processing

The printed circuit boards of electromagnetic flow converter are made via surface mount technology, Therefore, the user can not open the converter shell.
Intelligent converter with self--diagnosis function, in addition to alarm for power and hardware failures, generally it alarms appropriately. This information prompted the top right of the display a "!" Exclamation point or alarm bell symbol. In test mode, the next key to flip through to show failures as follows:
Flow works well
Excited alarm
Electrodes works well
Electrodes exception
Empty alarm

Failure processing

No display on the monitor

- a) Check whether the power is switched on.
 - b) Check the power fuse is intact.
 - c) Check the power supply is appropriate.
 - d) Check whether the monitor can adjust the contrast adjustment and whether the adjustment is appropriate.
 - e) If a), b), c) all work well, there is no way to figure it out on your own, please return the convertor to manufactor for repairmen.
- Excited magnetic alarm
- a) Check whether the EX1 and EX2 are open or not.
 - b) Check the resistance of excited magnetic coil of sensor is lower than 150 Ω or not.
 - c) If a)and b) are normal, that means the convertor as failed.

- Empty and electrodes alarm
- a) Check if target liquid has filled the measuring tube yet.
 - b) Input short circuit signal of SIG1, SIG2 and SIGGND into convertor. Meanwhile, if it prompt to revoke "empty alarm" and "electrode exception" , that means the convertor works normally. The error may come from low conductive liquid or the electrodes are covered by gas.
 - c) Check the signal connection is corrector not
 - d) Electrode exception

• Rev.Meas.Enbl

Reverse measurements allow you to set the "allowed" state, when the reverse flow of fluid when the converter output pulse by the value of the reverse flow and current, reverse a cumulative total. Reverse measurements allow to set in the "prohibited" state, when the reverse flow of fluid when the converter output pulse zero bit, current output signal is zero (4mA or 0mA), but the reverse is still a cumulative total

• Clr Tot.Key

In the parameter setting, the user into "total Totalizer clear" the password, confirm the password is correct instrument, the amount automatically cleared Totalizer. At the same time clearing The three integrator zero value, restart the cumulative
Integrating the total clearing "the password can open the 3 password, in the" clear totalizer volume password "menu you wish to set into the" total Totalizer clear "password, modify the original" total Totalizer clear "password
Note: Please write down your "total Totalizer clear" password

• Sensor Fact

Instrument supporting the factory calibration of sensors on a single or a product label marked "sensor coefficient" should be consistent with the values into the menu

• Field Mode

Converter can provide three types of excitation to the sensor
Note: Factory set according to user situation, the user can not be changed

• Meter Factor

The coefficient is the coefficient of artificial, the converter when the internal calculation of the total traffic flow is measured by multiplying the coefficient. For example, the sensor used in open channels with the simulation of electromagnetic flowmeter measurements or field diving on the instrument after calibration correction

Fluid filled in the sensor case, use 500 analog multimeter, Resistance $\times 1 K\Omega$ file, check the sensor electrode resistance. Connect the red terminal of multimeter with electrodes and connect black terminal with wetted electrode (wetted ring or metal pipe), the pointer of multimeter swing from left to right, indicate to about 3 ~ 50K Ω , and discharge from right to left; if the two electrodes swing range is less than 20%,that is, the electrodes are not conta minated.

Use digital multimeter to detect the direct current between wetted connecting point of DS1 and DS2 such as wetted electrode, then the liquid ring, metal pipes. The direct current should be lower than 1 V, the direct voltage difference should lower than 50 mV . Otherwise, the electrode of flow meter is non--polarized
Upper limit alarmring the detecting range will revoke the alarm.
Lower limit alarm
Lower limit alarm, the output current and output frequency (or pulse) are overrun. Lowing down the detecting range will revoke the alarm. The system will automatically recognize the flow range , Flow totalizer units and pulse equivalent set.It is easy to adjust. When the system automatically alarm, please return the convertor to manufactor for repairmen.
When the detection of flow is incorrect,
a) Check whether the target liquid full the measuring tube.
b) Check the connection is working or not.
c) Check the sensor module and whether the zero point is same as shown on the label.

Material	corrosion resistance
Acid-proof steel 1Cr18Ni9Ti	Great corrosion resistance to nitric acid, phosphoric acid and other inorganic acids, a variety of salt and alkali solutions, organic acids, seawater. No corrosion resistance of Sulfuric acid, hydrochloric acid, hydrofluoric acid, and boiling formic acid, oxalic acid, industrial chromic acid, as well as sodium and chlorine, bromine, iodine and other media, poor chemical stability.
Molybdenum-containing stainless steel Cr18Ni12Mo2Ti	Stronger corrosion resistance to 50% nitric acid, 5% of sulfuric acid at room temperature, alkali solution, boiling phosphoric acid, formic acid, sulfurous acid under certain pressure, seawater, acetic acid, and other media. Intolerance to hydrofluoric acid, hydrochloric acid, chlorine, bromine, iodine and other media.
Hastelloy B	Resistance to sulfuric acid, phosphoric acid, hydrofluoric acid, organic acids and other non-oxidizing acid, alkali, salt solution of non oxidative corrosion. Oxidation of nitric acid does not apply.
Hastelloy C	Resistance to oxidizing acids, such as nitric acid. Also resistant to oxidative corrosion of salts such as Fe ³⁺ . On the seawater corrosion resistance is very good. Hydrochloric acid reduction does not apply.
Ti	Capability of sea water, various oxides and hypochlorite, oxidizing acids (including fuming nitric acid), organic acids, alkali, corrosion and the reduction of pure impatience acid (such as sulfuric acid, hydrochloric acid) and corrosion. However, if the acid contains oxidants (such as nitric acid, Fe, Cu) when the corrosion is substantially reduced.

Ta	With excellent corrosion resistance and it is very similar to glass. In addition to hydrofluoric acid, fuming nitric acid, alkali, it has capability to resistant almost of the corrosion all chemical media (including the boiling point of hydrochloric acid, nitric acid and sulfuric acid below 175 °C) n. It is not corrosion in the sodium hydroxide base.
Pt	Various acids are very good corrosion resistance, alkali and salt corrosion of various types, but the impatience to aqua regia corrosion.

Liner material	Function	Operation temperature	Application
polytetrafluoroethylene PTFE	PTFE is the most stable chemical material of plastics. It is capable to resistant boiling hydrochloric acid, sulfuric acid, nitric acid and aqua regia. It is able to resistant concentrated alkali, and various organic solvents.	-25-180℃	Pressure pipe measuring acid, alkali and salt, and other high wear medium, not be used for vacuum pipe.
PFA	Poor wear resistance and poor adhesion. The corrosive resistance is similar to PTFE and it is able to resistant strong acid alkali, salt solution and various organic solvents. Poor wear resistance	-25-180℃	Acid, alkali and salt and other strong corrosive wear of non-strong media, vacuum pipe.
FEP(F46)	F46 is a modification of PTFE materials with chemical resistance similar to PTFE, the wear resistance is poor.	-25-180℃	Acid, alkali and salt and other strong corrosive wear of non-strong media
Neoprene	It has excellent flexibility, high extension, good wear resistance. It resistant general low concentration of acid, alkali and salt corrosion media, Intolerant of oxidative corrosion medium	≤80℃	General water, sewage, mud, slurry.
Polyurethane	It has an excellent wear resistance, (the equivalent of ten times the natural rubber), Poor anti-acid and anti-alkali ability.	≤45℃	Strong wear neutral slurry, coal slurry, mud.
